

Wi-Fi Mesh Networking: IEEE 802.11s

Piotr Mitoraj

`mitoraj@cs.tut.fi`

Tampere University of Technology
Department of Communications Engineering

November 3, 2009

Outline

- 1 Mesh Networking
 - Introduction
 - Theoretical Background
- 2 Standardization Efforts IEEE 802.11s
 - Fundamentals
 - MAC Layer
 - Routing
- 3 tutmesh - mesh network testbed at TUT
 - Overview
 - Hardware & software

Outline

- 1 Mesh Networking
 - Introduction
 - Theoretical Background
- 2 Standardization Efforts IEEE 802.11s
 - Fundamentals
 - MAC Layer
 - Routing
- 3 tutmesh - mesh network testbed at TUT
 - Overview
 - Hardware & software

Mesh networking

- Wired networks - full mesh topology
- All to all connections
- "knotted material of open texture with evenly spaced holes"
Merriam-Webster dictionary
- In wireless networking mesh is a wireless backbone

IEEE 802.11 reminder

- Basic Service Set (BSS)
- Independent Basic Service Set (IBSS)
- Extended Service Set (ESS)

Outline

- 1 Mesh Networking
 - Introduction
 - Theoretical Background
- 2 Standardization Efforts IEEE 802.11s
 - Fundamentals
 - MAC Layer
 - Routing
- 3 tutmesh - mesh network testbed at TUT
 - Overview
 - Hardware & software

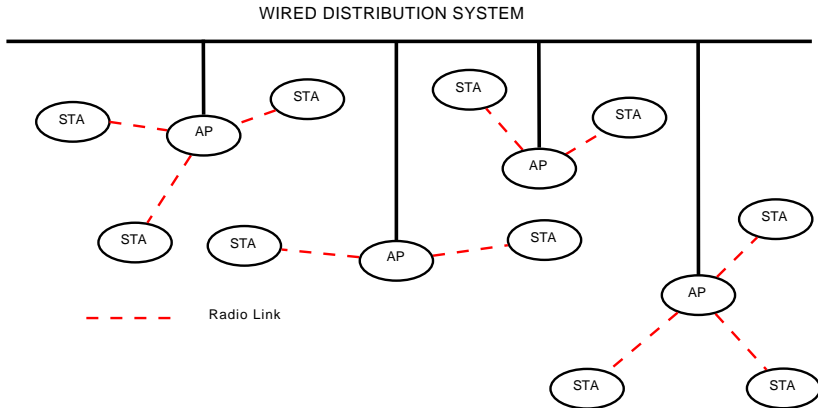

Wireless Mesh Networks

Main Features

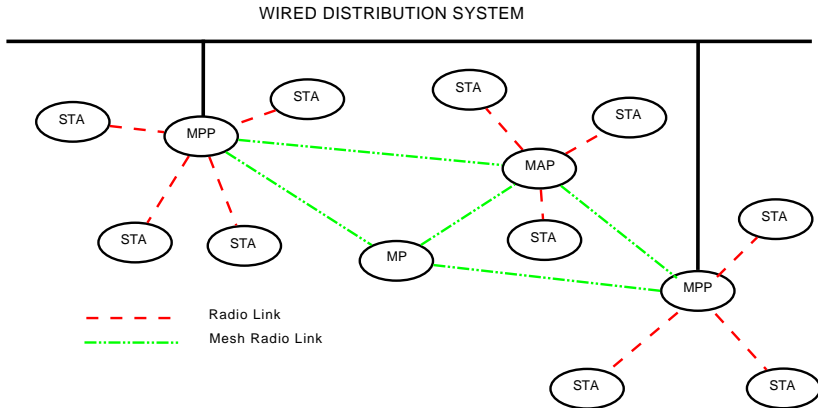

- Self-organizing backbone
- Overlapping coverage
- Lack of wired distribution system
- Freedom in selecting the node location

Extended Service Set

Mesh Extended Service Set

Advantages

- Fast deployment
- Low cost
- Removes dead spots
- Very scalable
- Easy network maintenance
- Robust
- etc...

Outline

- 1 Mesh Networking
 - Introduction
 - Theoretical Background
- 2 Standardization Efforts IEEE 802.11s
 - Fundamentals
 - MAC Layer
 - Routing
- 3 tutmesh - mesh network testbed at TUT
 - Overview
 - Hardware & software

Motivation

- Many companies were developing proprietary mesh solutions independently
- Lack of interoperability between vendors
 - Nortel, MITRE, Philips, Thomson, etc. (Wi-mesh)
 - Intel, Motorola, Nokia (SEEMesh Simple Efficient Extensible)
 - BelAir Networks, Tropos Networks, Strix Systems (outsiders)
- IEEE 802.11s Task Group formed in July 2004
- Joint proposal contributed to the first draft (1.0) of the standard

New network entities

- Mesh Point (MP)
implements the basic functionality of path selection and forwarding the traffic of other MPs. It might be used to interconnect two remote parts of the mesh cluster.
- Mesh Access Point (MAP)
Same functionality as bare MP. Additionally, it serves as a legacy AP for the STA nodes. In simpler terms, it is an MP collocated with AP.
- Mesh Portal (MPP)
Same functionality as bare MP. Moreover, it is a gateway to the external network, e.g. Ethernet or WiMax. It is an MP collocated with a gateway.

Usage Scenarios

- Residential/Consumer Electronics
 - single building or flat
 - audio and video streaming
 - eliminate the dead spots and low quality areas
- Office
 - cabling not feasible
 - scalability
 - cost reduction
- Campus/Community/Public Access Network
 - wider coverage
 - lower cost and higher bandwidth
 - fast deployment and scalability

Usage scenarios

- Public Safety

- emergency response: such as fire, police and emergency workers at the accident scene
- video surveillance, voice communication, collection of the data from sensors

- Military

- non-combat and combat
- extreme mode mobility
- fully automated network management
- power preservation schemes for detached nodes

IEEE 802.11s

- Routing
 - Hybrid Wireless Mesh Protocol (HWMP)
 - First standard to define layer 2 routing
- Medium Access techniques
 - Enhanced Distributed Channel Access (EDCA)
 - mandatory
 - Mesh Deterministic Access (MDA)
 - introduces novel medium access method
 - optional

Open source implementation

- <http://www.open80211s.org/>
- Present in the Linux Kernel since 2.6.26
- Supported wireless drivers: ath5k, b43, libertas_tf, p54, zd1211rw
- Sponsors: Nortel, cozybit, olpc, google,

Outline

- 1 Mesh Networking
 - Introduction
 - Theoretical Background
- 2 Standardization Efforts IEEE 802.11s
 - Fundamentals
 - **MAC Layer**
 - Routing
- 3 tutmesh - mesh network testbed at TUT
 - Overview
 - Hardware & software

EDCA drawbacks in multihop environment

- Designed for single hop wireless networks
- Dense deployment of MPs leads to large amount of exposed terminals
- No means to prioritize backbone traffic over locally generated traffic
- Unaware station problem

Ongoing transmission between A and B blocks node C being close to B. Node D placed outside A's Energy Detection (ED) range is an unaware station. It may try several retransmissions to not responding C node

MDA

- Currently 802.11 does not include any multi-hop scheme allowing two stations outside mutual radio range to communicate
- Separates a negotiation process and medium reservation
- More awareness of the difficult radio environment
- Mitigates unaware station problem
- MP exchange the information about:
 - Their own Tx and Rx transmission periods (MDAOP)
 - Their neighbors' Tx and Rx transmission periods, interference reports

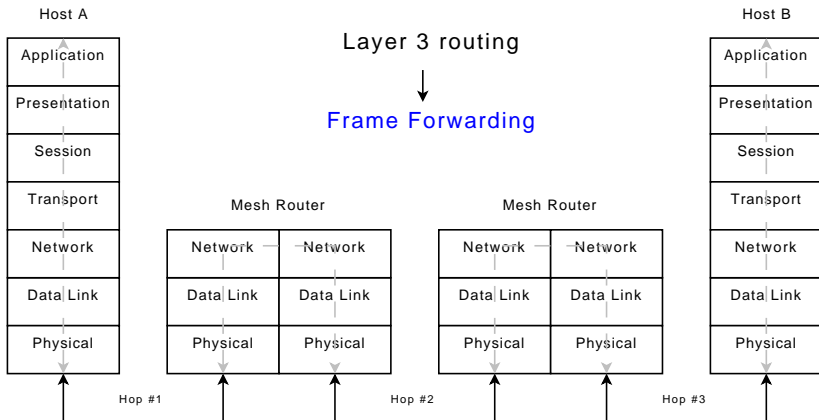

Outline

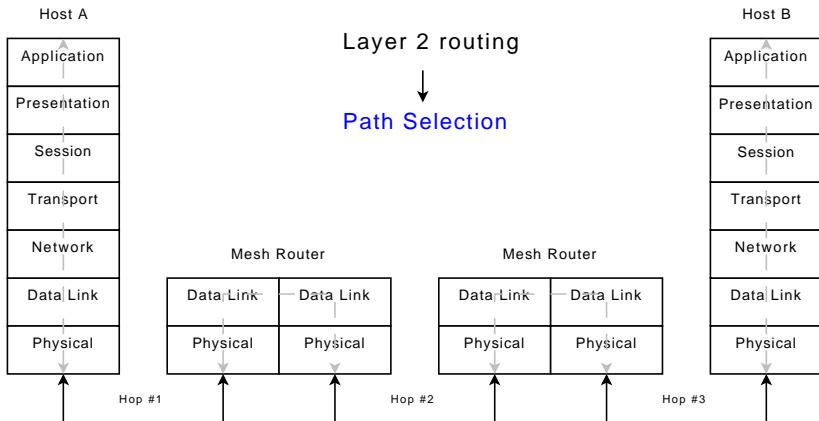

- 1 Mesh Networking
 - Introduction
 - Theoretical Background

 - Routing
- 3 tutmesh - mesh network testbed at TUT
 - Overview
 - Hardware & software

Network layer routing

IEEE 802.11s ESS

HWMP overview

- Routing protocol must be aware of rapidly changing radio environment
- Combines on-demand routing with proactive tree-based approach, not exclusive
- The protocol specifies four information elements:
 - 1 PREQ – Path Request
Contains cumulative metric and destination address
 - 2 PREP – Path Reply
 - 3 PERR – Path Error
 - 4 RANN – Root Announcement
- Sequence numbers in use

HWMP Proactive tree building mode

1 Utilizing PREQ

- One node acts as a tree root
- Root node sends proactively PREQs
- Formation of paths between root and all other nodes

2 Utilizing RANN

- Root node periodically broadcasts RANNs
- Each node creates or updates the path to the root

HWMP Reactive path selection mode

- ❶ Node A needs to discover a path to the destination
- ❷ Node A broadcasts PREQ
- ❸ The recipients process the PREQ based on two flags:
 - Destination Only (DO)
 - Reply and Forward (RF)
- DO=1 (default)
 - Only the destination node is eligible to response with PREP,
 - RF flag has no influence,
 - All intermediate nodes learn the path to the destination
- DO=0 and RF=0
 - Intermediate node that knows the path to the destination may respond with unicast PREP,
 - Reduction of the path selection delay

HWMP Reactive path selection mode

- DO=0 and RF=1
 - The same behaviour as in the previous case, but
 - PREQ is being forwarded,
 - Intermediate node sets DO=1

Outline

- 1 Mesh Networking
 - Introduction
 - Theoretical Background
- 2 Standardization Efforts IEEE 802.11s
 - Fundamentals
 - MAC Layer
 - Routing
- 3 tutmesh - mesh network testbed at TUT
 - Overview
 - Hardware & software

Motivation

To deploy Wireless Mesh Network testbed

- IEEE 802.11
- Free (open source) software
- Embedded platform
- Dual-radio

Testbed topology

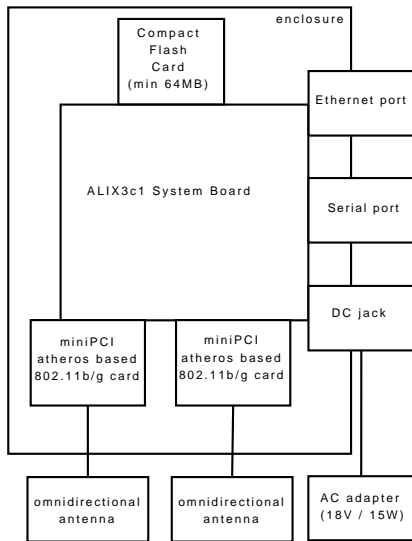

Outline

- 1 Mesh Networking
 - Introduction
 - Theoretical Background
- 2 Standardization Efforts IEEE 802.11s
 - Fundamentals
 - MAC Layer
 - Routing
- 3 tutmesh - mesh network testbed at TUT
 - Overview
 - Hardware & software

Mesh Router

- Alix3c1 board - PC Engines
- 2 Compex MiniPCI 802.11b/g wireless cards
- 1GB Compact Flash (CF) card
- 2 5dBi omni-directional antennas

Mesh Router platform

PCengine's Alix3c1

CPU	433 MHz AMD Geode LX700
DRAM	128 MB DDR DRAM
Storage	Compact Flash socket
Power	DC jack
Expansion	2 miniPCI slots, LPC bus
Connectivity	1 Ethernet channel
I/O	DB9 serial port
Board size	100 x 160 mm
Firmware	tinyBIOS
Power consumption	2.5-3.5 W (peak 5 W)

Software selection

- Operating System - Debian-based linux
- Wireless Drivers - MadWiFi
- dnsmasq - DHCP daemon
- iptables - Masquerade on the gateway node
- olsrd - Ad-hoc routing daemon
- GRUB - GRand Unified Bootloader

That's all

THANK YOU
